python-practice-test

1. Write a Python program which accepts a sequence of comma separated 4 digit binary numbers as its input and then check whether they are divisible by 5 or not.

The numbers that are divisible by 5 are to be printed in a comma separated sequence. Example: 0100,0011,1010,1001 Then the output should be: 1010

Code:

```
numbers = input().split(",")

result = []

for num in numbers:
    if int(num, 2) % 5 == 0:
        result.append(num)

print(",".join(result))
```

output:

2. Write a Python program that accepts a sentence and calculate the number of letters and digits.

Suppose the following input is supplied to the program: hello world!
123 Then, the output should be: LETTERS 10 DIGITS 3

Code:

```
sentence = input()

letters = 0
digits = 0

for ch in sentence:
    if ch.isalpha():
        letters += 1
    elif ch.isdigit():
        digits += 1

print("LETTERS", letters)
print("DIGITS", digits)
```

Output:

3. Write a program which can compute the factorial of a given numbers.

The results should be printed in a comma-separated sequence on a single line. Suppose the following input is supplied to the program: 8
Then, the output should be: 40320

Code:

```
n = int(input())

factorial = 1

for i in range(1, n + 1):
    factorial = factorial * i

print(factorial)
```

Output

```
1 n = int(input())
2
3 factorial = 1
4
5 for i in range(1, n + 1):
6     factorial = factorial * i
7
8 print(factorial)
```
